

Algebra 1: Unit 5, Lesson 9

1. Given the equation, $-3x + 6y = 5$, what operation can be performed to create the equivalent equation, $6x - 12y = -10$?

2. A system of linear equations is shown.

$$\begin{cases} 4x + 8y = 20 \\ 4x - 2y = 30 \end{cases}$$

To solve the system of equations by eliminating the y values, multiply the second equation by _____.

3. Write an equivalent equation to $-4x + 2y = -30$ by dividing all terms by 2.
