

## Algebra 1: Unit 6, Lesson 5

1. An inequality is shown.

$$y - 2 < \frac{3}{5}(2x + 6)$$

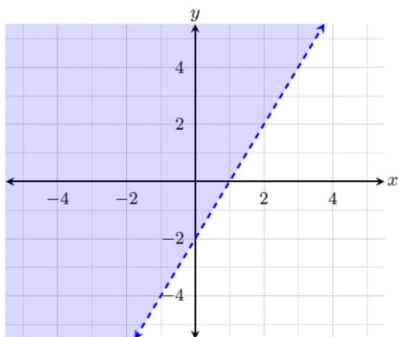

Determine if the point  $(-1, \frac{1}{2})$  is a solution to the inequality.

2. The graph of the line  $y = -2x + 3$  and some points are shown.

What is the inequality with a solution set that includes the dots?

3. The graph of the inequality  $y > 2x - 2$  is shown.

The coordinate  $(0, -2)$  \_\_\_\_\_ a solution to the inequality.
