

Algebra 1: Unit 10, Lesson 1

1. The graph of an absolute value function is shown on the coordinate plane.

What is the axis of symmetry?

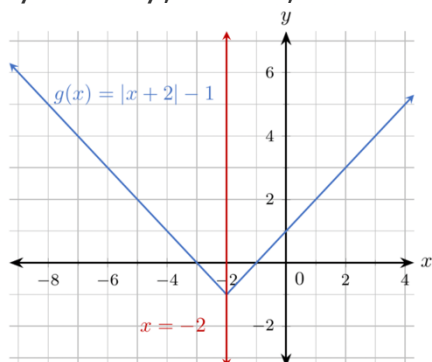

2. An absolute value function is shown.

$$f(x) = |x - 2| + 4$$

Complete the table of values for the absolute value function.

x	y
-2	8
-1	_____
0	6
1	5

3. The graph of the absolute value function $g(x) = |x + 2| - 1$ and the graph of its axis of symmetry, $x = -2$, are shown on the coordinate plane

Which point on the graph $g(x) = |x + 2| - 1$ is the same distance as $(-3, 0)$ from the axis of symmetry on the opposite side of the graph?
