

Use the following context to answer questions 1-4.

Members of the cross-country team are preparing for a 3-mile race. The average time for the team is 20.5 minutes. The fastest and slowest times varied from the average by 3.4 minutes.

1. Define the variable.
2. Write an absolute value inequality that represents the context.
3. Solve the inequality. Write the answer as a compound inequality.
4. Graph the solution on the number line.

Use the following context to answer questions 5-6.

Franklin is a member of the high school band. Each day he spends an average of 55 minutes practicing for an upcoming band concert. He spent less time practicing on school days, but more time on the weekends. Each of his daily practice times was within 27 minutes of his average.

5. Write an absolute value inequality that represents m , the number of minutes Franklin spends practicing for the band concert on a given day.
6. Solve the inequality.

Use the following context to answer questions 7-10.

Hailey made a personal goal of earning \$130 per week at her after-school job. Each week, she has been averaging within \$23.15 of her goal.

7. Define the variable.
8. Write an absolute value inequality that represents the context.
9. Solve the inequality. Write the answer using set-builder notation.
10. Graph the solution on the number line.
