

The graph of an exponential function is shown.

1. Find the value of a by substituting the point $(0, 2)$ in for x and y in $y = a(b)^x$.

$$\boxed{} = a(b)^{\boxed{}}$$

2. Use the value of a found in question 1 and the point $(1, 3)$ to determine the value of b .

3. Write the function for the graph in both forms.

$f(x) = a(b)^x$	$f(x) = a(1 \pm r)^x$

The table of an exponential function is shown.

x	0	1	2	3	4
$f(x)$	-7	-14	-28	-56	-112

4. What is the initial value, a ?
5. How does the value of $f(x)$ change as the x -value increases by 1?
6. Write the function in the form $f(x) = a(b)^x$

For questions 7 – 10, write an equation from the table or graph by finding the initial value, a , and common ratio, b .

7.

Function

8.

Function

9.

x	y
0	-5
1	$-\frac{25}{4}$
2	$-\frac{125}{16}$
3	$-\frac{625}{64}$
4	$-\frac{3125}{256}$

Function

10.

x	y
0	3
1	2.1
2	1.47
3	1.029
4	0.7203
