

Algebra 1: Unit 13, Lesson 1

1. Raine invested \$3,600 into a 13-year certificate of deposit (CD). To monitor her money, Raine graphed the equation that models her investment.

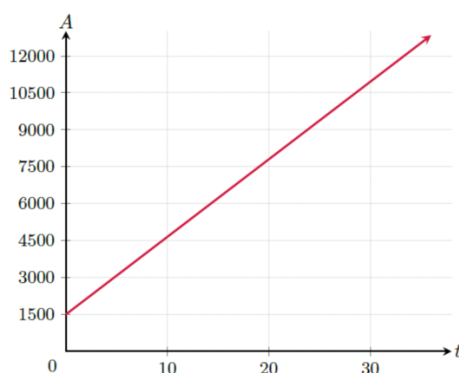

What does the y -value of the coordinate, $(13, 7812)$ represent?

2. The equation, $A = 150(1 + 0.15t)$, can be used to determine the final amount, A , in a savings account at a neighborhood bank after t years.

What is the original amount?

3. The graph of the equation $A = 1500(1 + 0.21t)$, where A is the final amount in a certificate of deposit (CD), t years after the account was opened, is shown.

After how many years will the value of the CD be at least \$4,500?
