

Algebra 1: Unit 13, Lesson 4

1. The table of values for the function, $D(x)$, is shown.

$D(x)$	
x	y
-4	5
-3	0
-1	-4
0	-3
1	0
3	12
4	21

What kind of function is $D(x)$?

2. The equation, $y = 450(1.45)^x$, represents exponential growth. What is the initial value of the function and the rate of growth?

3. Consider the exponential decay function, $f(x) = 17310(0.898)^x$.

What is the rate of decay?
