

Algebra 1: Unit 13, Lesson 10

1. The table of values for function $f(x)$ is shown.

x	$f(x)$
-1	1
0	5
1	9
3	17
4	21

What type of graph represents $f(x)$?

2. Peter and Brian are working together on identifying types of functions from descriptions. The following description is given for a function. "The y -values of function $M(x)$ decrease as the x -values decrease. The y -values decrease by a factor of 0.25."

Peter states the function is linear and Brian states the function is exponential decay. Who is correct?

3. The table of values models the growth of population, $M(x)$ in a small town in rural Florida, x years since 2016. The graph of the function to model this scenario is also shown.

x	$M(x)$
1	3112
2	2839
3	2656
4	2563
5	2560
6	2647

The $M(x)$ values are not changing at a constant rate. The graph that represents the values in the table is what type of graph?
