

Algebra 1: Unit 14, Lesson H2

1. Vivian conducted a survey among a group of male and female adults on whether they prefer to be contacted via text message or email. The partial results of the survey are summarized.
 - Of those that preferred to be contacted via text message, 51.77% were male.
 - 47.43% of the females preferred to be contacted via email.

An incomplete two-way relative frequency table of the data is shown.

	Text Message	Email	Total
Males			52.01%
Females			47.99%
Total	70%	30%	100%

What percent of participants in the survey are females who prefer to be contacted by email?

2. A survey was conducted among a group of male and female adults on whether they prefer summer weather or winter weather. The results of the survey are summarized in the two-way relative frequency table.

	Summer Weather	Winter Weather	Total
Males	21.88%	29.37%	51.25%
Females	23.12%	25.63%	48.75%
Total	45%	55%	100%

The value $\frac{21.88\%}{45\%}$ means what percent of all the people surveyed who were male preferred summer weather?

3. A survey was conducted among a group of male and female adults on whether they prefer to read with a physical copy of a book or an eReader. The relative frequency table shown summarizes the results of the survey.

	Physical Book	eReader	Total
Males	21.87%	29.38%	51.25%
Females	23.13%	25.63%	48.75%
Total	45%	55%	100%

What is the conditional relative frequency of females that prefer to read a physical copy of a book?
