

Geometry: Unit 7, Lesson 8

1. Right triangles PMK and MJK are shown with a shared side, $\overline{MK}$, where $\angle PKM$ and $\angle MJK$ are right angles, $m\angle MPK = 54^\circ$, and $m\angle MJK = 36^\circ$. What expression can be used to find $m\angle PMJ$?

2. Right triangles PMK and MRK are shown with a shared side, $\overline{MK}$, where $\angle PKM$ and $\angle MKR$ are right angles, $m\angle MPK = 59^\circ$, $m\angle MRK = 31^\circ$, $MR = 7$, and $KR = 6$. What is the length of $\overline{MK}$, in simplest radical form?

3. Right triangles RBW and BKW are shown where $m\angle RBW = 90^\circ$, $m\angle KWB = 30^\circ$, $RW = 4.1$, and $RB = 3$. Which of the following side lengths must be found to determine the area of $\triangle KBW$?
