

Triangles BWN , $B'W'N'$, and $B''W''N''$ are shown on the coordinate grid where $\triangle BWN$ is the preimage.

- 1. Describe the feature of $\triangle B'W'N'$ that indicates the rigid motion that was applied to $\triangle BWN$ that resulted in $\triangle B'W'N'$.
- 2. Show the feature described by mapping the transformation of one vertex of $\triangle BWN$ to $\triangle B'W'N'$.
- 3. Complete the table.

Transformation	Mapping	Algebraic Description
	$\triangle BWN \rightarrow \triangle B'W'N'$	

- 4. Map the transformation of one vertex of $\triangle B'W'N'$ to $\triangle B''W''N''$.
- 5. Complete the table.

Transformation	Mapping	Algebraic Description
	$\triangle B'W'N' \rightarrow \triangle B''W''N''$	

Triangles RKH and BYT are shown on the coordinate grid where $\triangle RKH$ is the preimage.

- 6. Describe the feature of $\triangle TYB$ that indicates that more than one rigid motion was applied to $\triangle RKH$.
- 7. Draw $\triangle R'K'H'$, the result of the first transformation that was applied to $\triangle RKH$.
- 8. Map the transformation of one vertex of $\triangle R'K'H'$ to $\triangle BYT$.
- 9. Complete the table.

Transformation	Mapping	Algebraic Description
	$\triangle RKH \rightarrow \triangle R'K'H'$	
	$\triangle R'K'H' \rightarrow \triangle BYT$	

- 10. Explain how to know if the sequence of transformations preserves distance.
