

Geometry: Unit 4, Lesson 3

1. A sequence of transformations is described using algebraic descriptions.

$$(x, y) \rightarrow (x, -y)$$

$$(x, y) \rightarrow (x + 4, y - 3)$$

What sequence of transformations is described?

2. In order to use algebraic descriptions to describe a sequence of transformations to map one figure to another, what must be performed around the origin?
3. Given the written description: "A figure is rotated 90° clockwise around the origin", write the algebraic description of the transformation starting with (x, y) .
