

Geometry: Unit 4, Lesson 8

1. Quadrilateral $DRFM$ and quadrilateral $CSGT$ are shown. To transform $DRFM$ into $CSGT$, first you must perform a reflection over the $y = x$ line. What is this reflection represented as an algebraic description?

2. If there is a sequence of rigid motion transformations that maps one figure onto another, what does that prove?

3. Triangle BMR and its transformations are shown on the coordinate grid. What figure is the result of a reflection over the x -axis of triangle BMR ?
