

Geometry: Unit 6, Lesson 5

1. A triangle with vertices $(2, -2)$, $(8, -4)$, and $(5, 4)$ is rotated 90° clockwise about the origin. What is an example of one of the vertices on the rotated triangle?

2. Five points on the coordinate plane are shown. The point, X , located at $(-3, 2)$ is transformed according to the rule, $(x, y) \rightarrow (x - 2, y - 4)$. Which point on the graph represents the transformed point?

3. Point M has the coordinates $(3, 8)$. What are the coordinates of point M' after a rotation of 180° clockwise about the origin.
