

Geometry: Unit 6, Lesson 6

- Triangle $W''N''P''$ is the result of a transformation of $\triangle WNP$ as shown. The side lengths of $\triangle WNP$ are 4, 4, and $4\sqrt{2}$. The side lengths of the corresponding sides of $\triangle W''N''P''$ are 3, 3, and $3\sqrt{2}$, respectively. What is the relationship between $\triangle W''N''P''$ and $\triangle WNP$?

- Quadrilaterals $NBFT$, $N'B'F'T'$, and $N''B''F''T''$ are shown on the coordinate grid. What transformation was applied to create $N'B'F'T'$ from $NBFT$?

- A rotation is an example of a rigid transformation because what is preserved?
