

Geometry: Unit 6, Lesson H3

1. To justify that two triangles are similar using the Side-Side-Side Similarity Theorem, what must occur?
 2. To justify that two triangles are similar using the Side-Angle-Side Similarity Theorem, the ratios of two pairs of corresponding sides need to be equivalent and what needs to be congruent?
 3. $\triangle GHC$ and $\triangle HNK$ are shown. $\overline{CG} \parallel \overline{NK}$. What angle is approximately equal to $\angle CHG$?
