

Geometry: Unit 10, Lesson 9

1. Circle R is shown with points Y , L , W , and K on the circle. Point H is inside the circle and point P is outside the circle. What equation can be used to find the measure of $\widehat{YK}$?

2. Circle W is shown with points Y , H , L , and R on the circle and point C outside the circle. $\angle LCH$ is formed by the intersection of segments $\overline{LC}$ and $\overline{YC}$ which meet outside the circle at point C . $m\widehat{YRL} = 210^\circ$ and $m\widehat{HL} = 65^\circ$. What is half the difference of $m\widehat{YRL}$ and $m\widehat{HL}$?

3. Circle P is shown with points K , H , W , and M on the circle. Point R is inside the circle and point S is outside the circle. What is a secant of circle P ?
