

Geometry: Unit 11, Lesson 7

- Triangle NBL is shown, with point W on $\overline{NB}$, point P on $\overline{BL}$, and point K on $\overline{NL}$. Point G lies inside the triangle. $WB = 10$, $BP = 6.4$, $PL = 6.4$, $KL = 7.5$, $NK = 7.5$, and $WN = 10$. What are the midpoints of the sides of $\triangle NBL$?

- The point that divides a segment into two congruent parts is called what?
- Constructing a perpendicular bisector can be used to find what?
