

11.H1.3 Activity

Triangle – Method 1

Use a compass to draw a circle. Mark the center and label it.

Keep the span of the compass used to draw the circle.

Mark any point on the circumference of the circle.

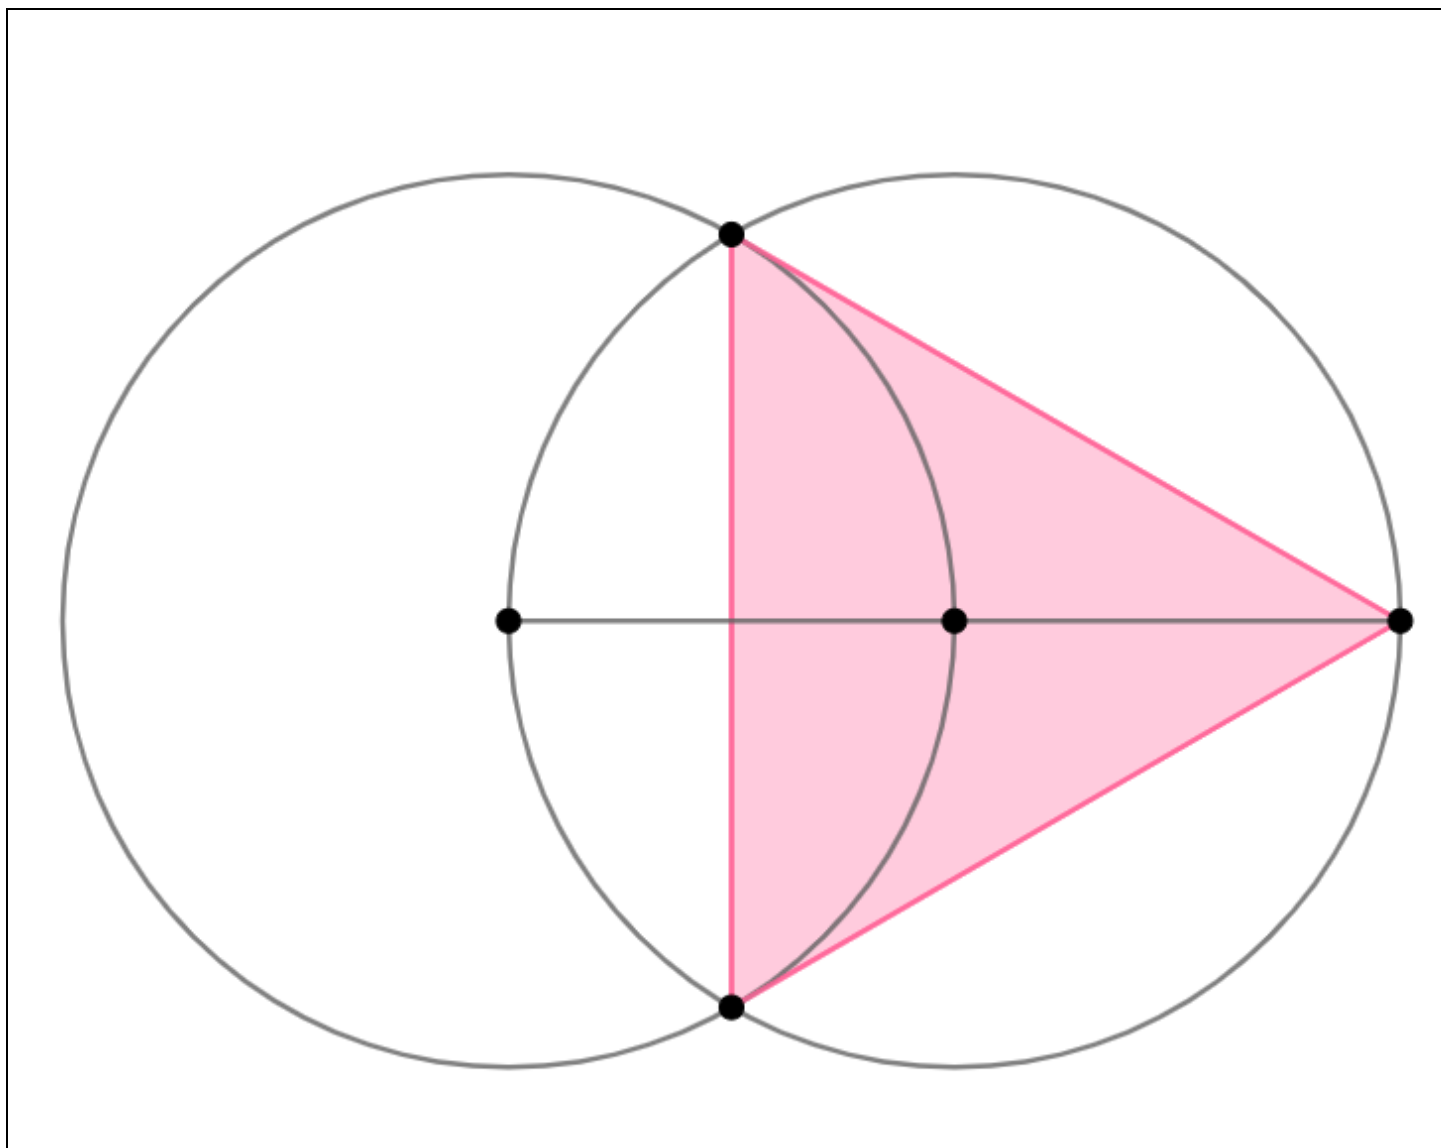

Place the endpoint of the compass on the marked point and make a small arc on the circumference of the circle.

Continue around the circle making a total of 5 small arcs.

Place a point at every other arc.

Connect the points.

Triangle – Method 2

Use a compass to draw a circle. Mark the center and label it.

Keep the span of the compass used to draw the circle.

Draw a diameter. Label the endpoints.

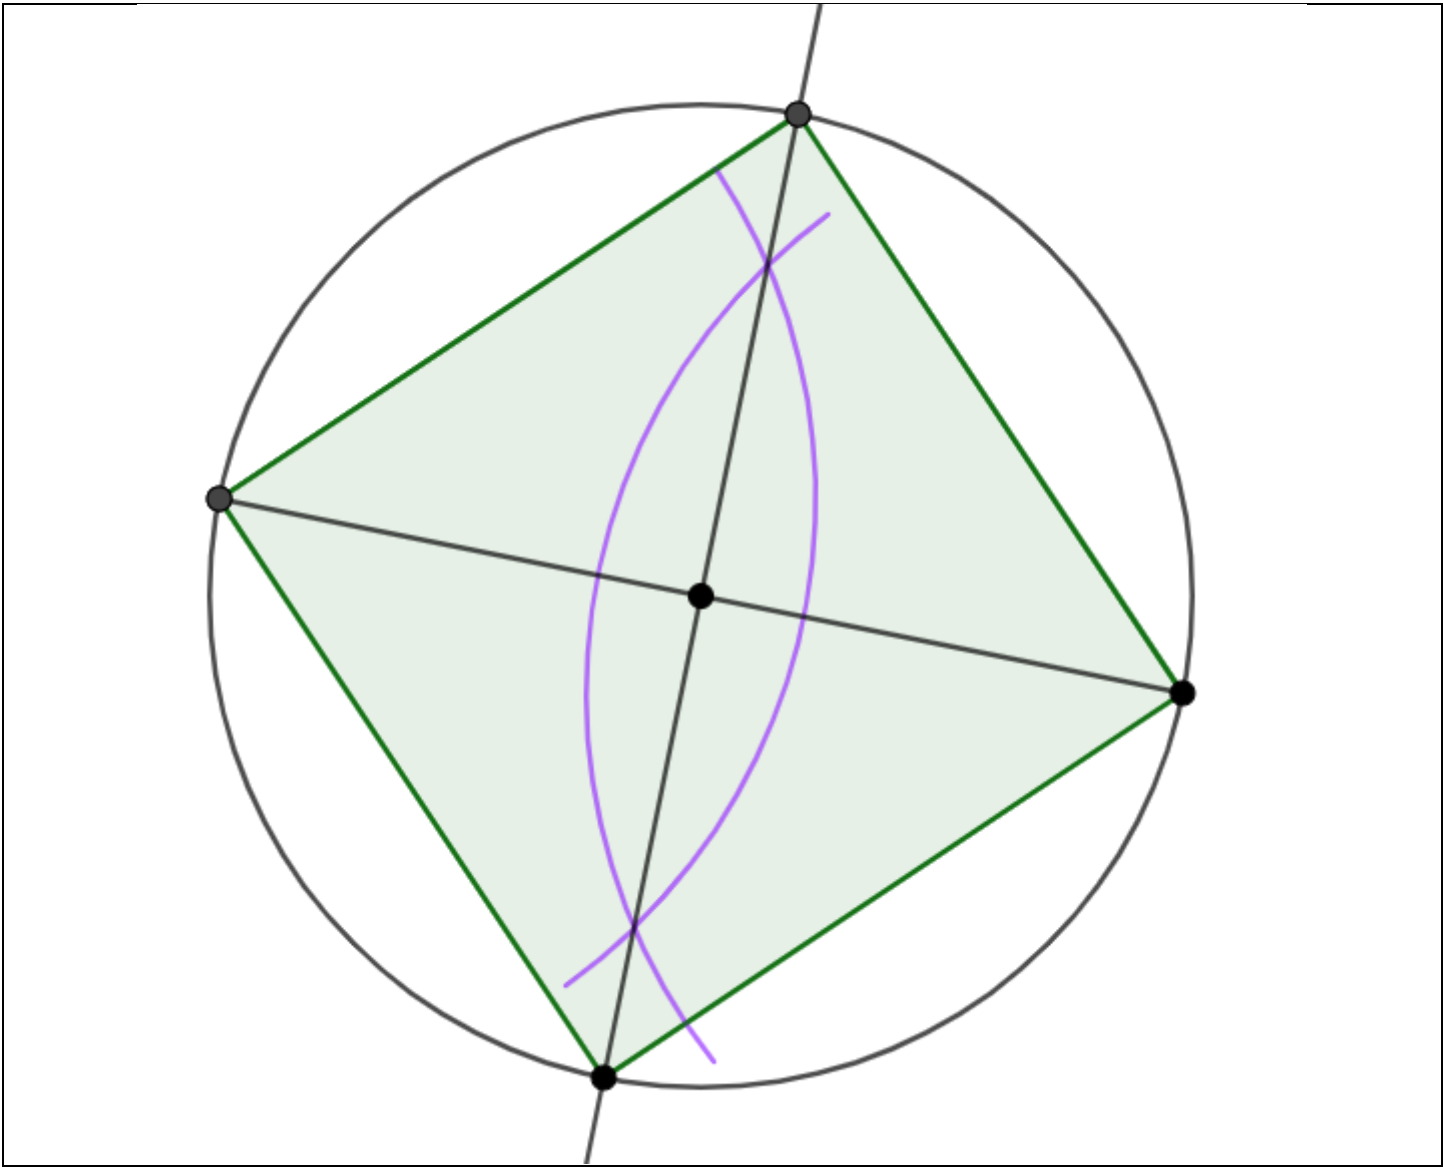

Place the endpoint of the compass on one of the endpoints of the diameter.

Draw a circle.

Label the intersections of the new circle with the original circle.

Connect the intersections with the other endpoint of the diameter.

Square – Method 1

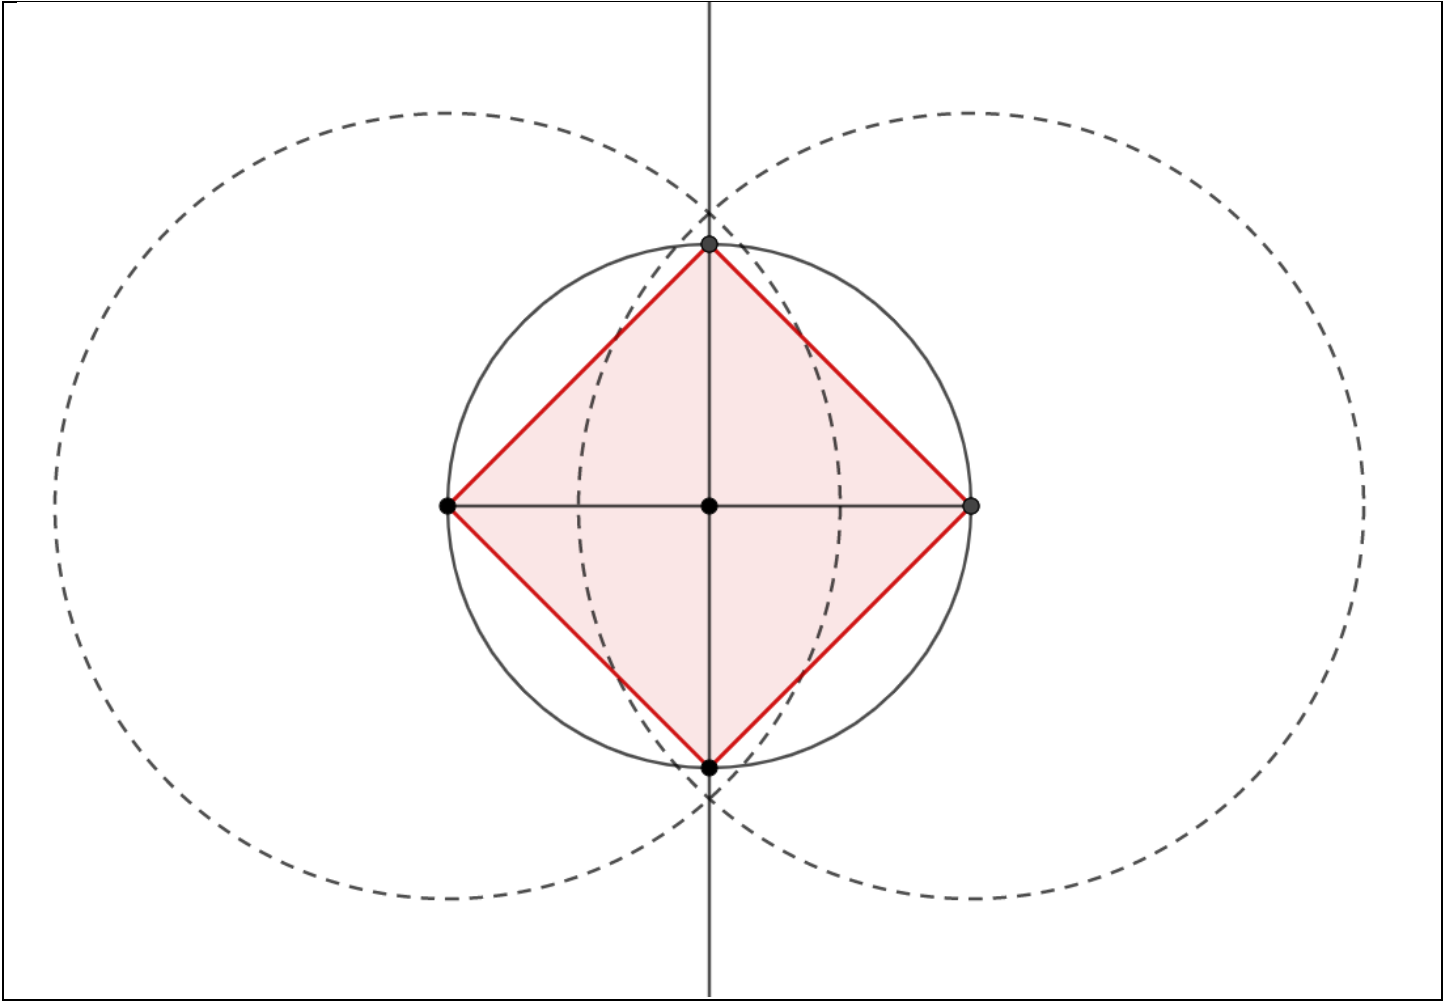

Use a compass to draw a circle. Mark the center and label it.

Draw a diameter. Label the endpoints.

Construct a perpendicular bisector of the diameter. Label the points that intersect with the circle.

Connect the points.

Square – Method 2

Use a compass to draw a circle. Mark the center and label it.

Draw a diameter. Label the endpoints.

Construct a circle with a radius larger than the original circle with center at one endpoint of the diameter.

Construct a circle with a radius larger than the original circle with center at the other endpoint of the diameter.

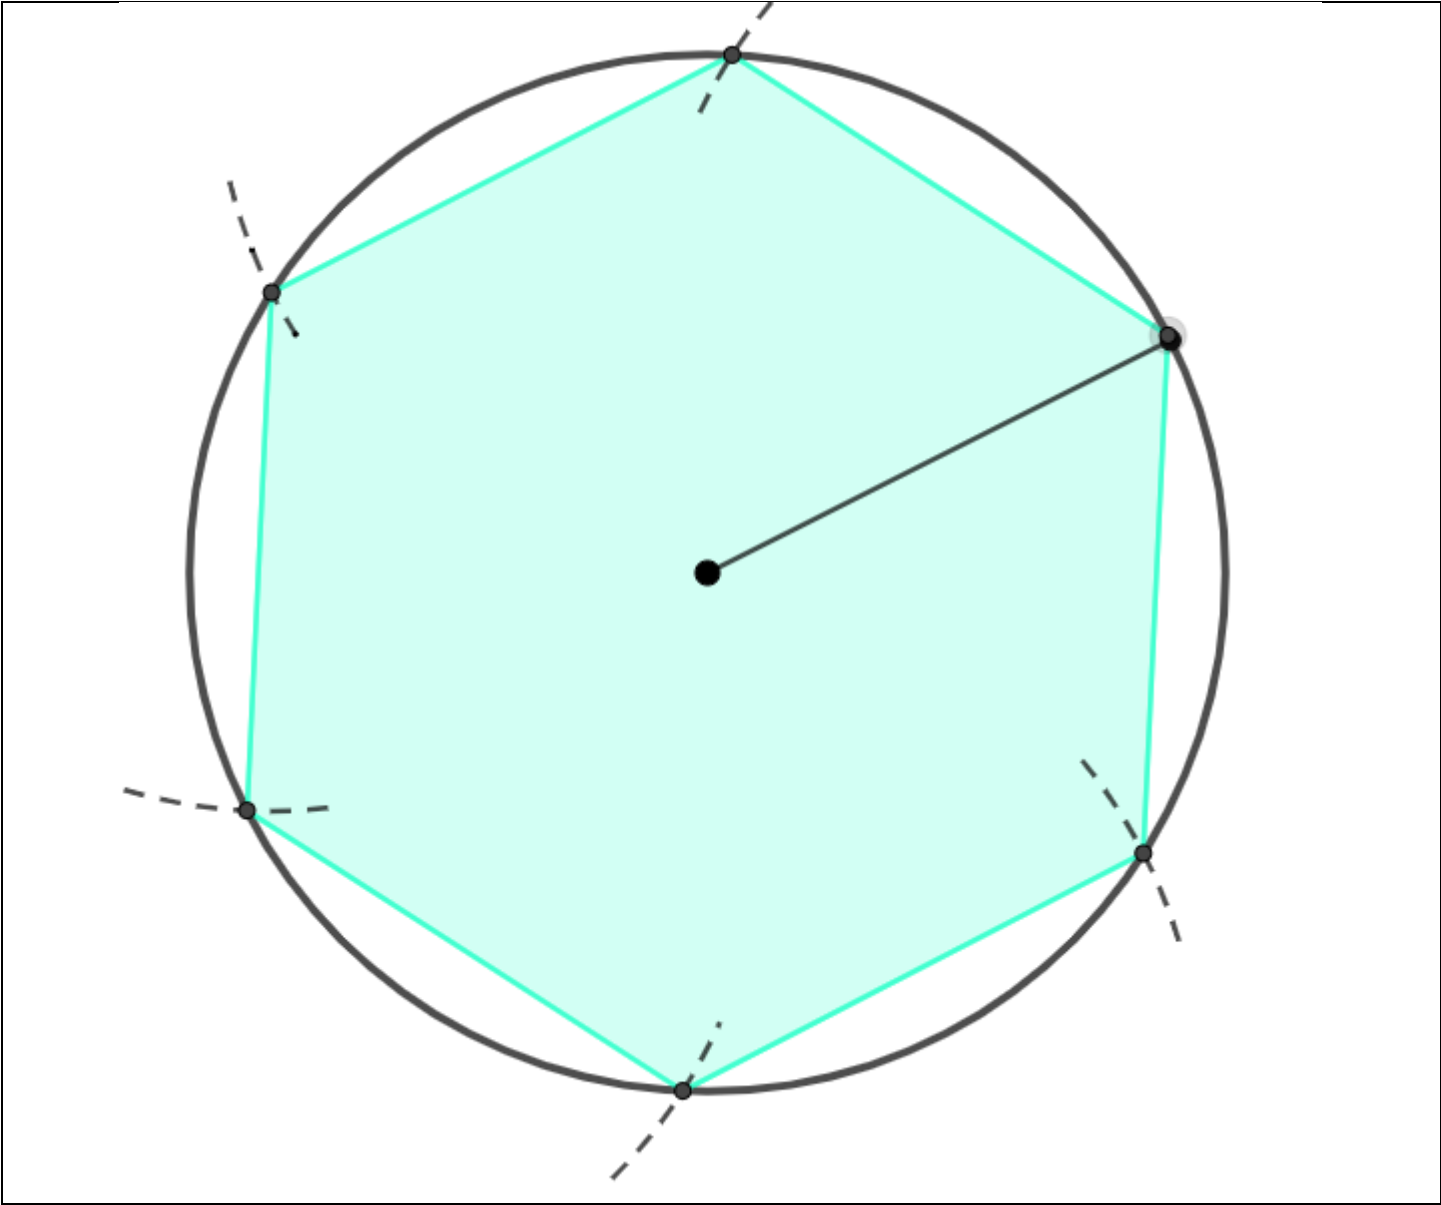

Mark the intersections of the two circles.

Draw a line through the intersection of the two circles and the original circle's center.

Mark the two intersections of the line and the original circle. Label the points.

Connect the points.

Hexagon – Method 1

Use a compass to draw a circle. Mark the center and label it.

Keep the span of the compass used to draw the circle.

Mark any point on the circumference of the circle.

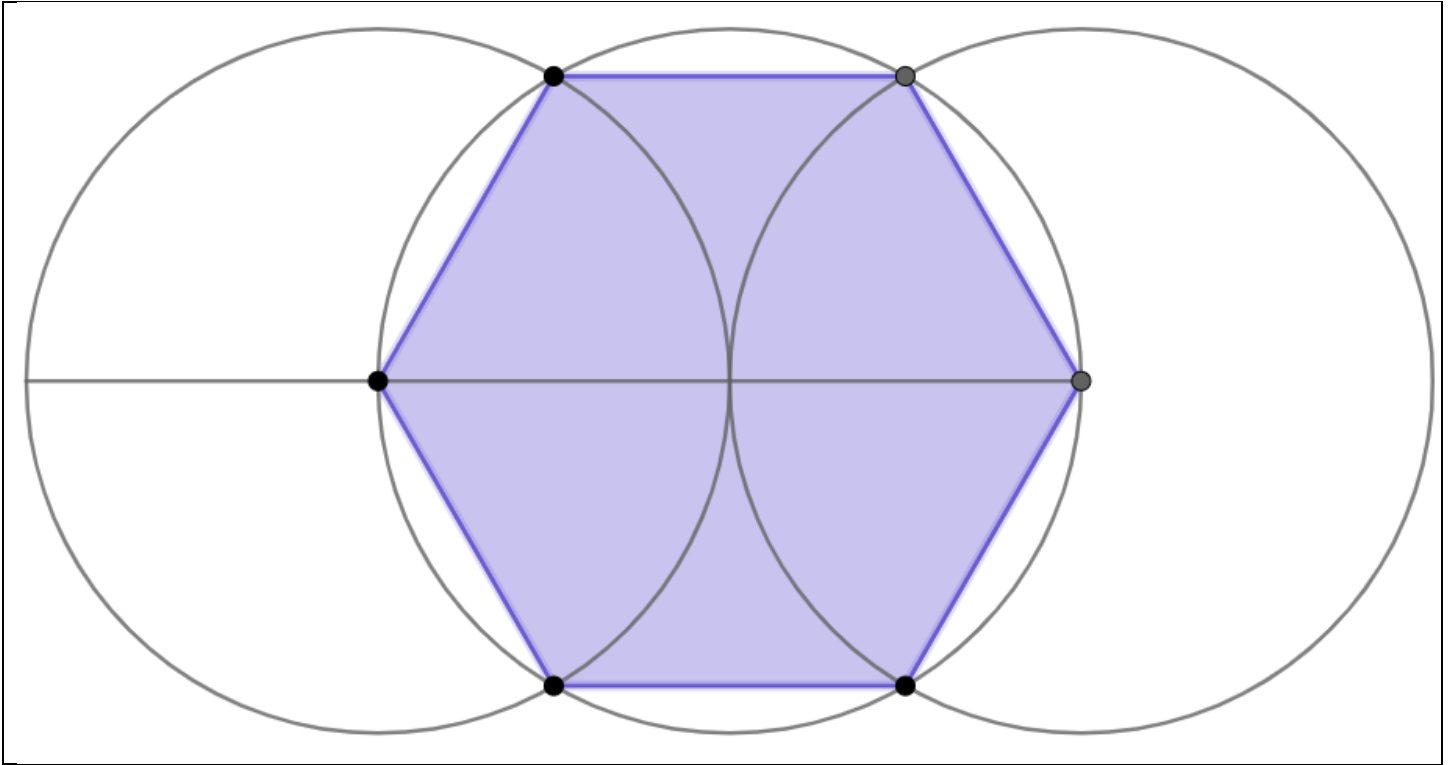

Place the endpoint of the compass on the marked point and make a small arc on the circumference of the circle.

Continue around the circle making a total of 5 small arcs.

Place a point at every arc.

Connect the points.

Hexagon – Method 2

Use a compass to draw a circle. Mark the center and label it.

Keep the span of the compass used to draw the circle.

Draw a diameter. Label the endpoints.

Place the endpoint of the compass on one of the endpoints of the diameter.

Draw a circle.

Label the intersections of the new circle with the original circle.

Place the endpoint of the compass on the other endpoint of the diameter.

Draw a circle.

Label the intersections of the new circle with the original circle.

Connect the intersections of both circles and the endpoints of the diameter.
