

Complete the missing steps showing one way to construct an equilateral triangle inscribed inside a circle.

Step	Procedure
1	Use a compass to draw a circle. Mark the center and label it.
2	Draw a diameter. Label the endpoints B and C .
3	Without changing the span on the compass, place the compass on point C .
4	Draw a circle using point C as your center.
5	Label the points of intersection of the two circles circumferences as x and y (or any letter)
6	Draw segments in circle A connecting $\overline{BX}$, $\overline{XY}$, and $\overline{BY}$.

Use Point A to construct an equilateral triangle inside a circle.

Complete the missing steps showing one way to construct a square inscribed inside a circle.

Step	Procedure
1	Use a compass to draw a circle. Mark the center and label it.
2	Draw a diameter and label them M and K .
3	Construct a circle with a radius larger than the original circle with the center at one endpoint of the diameter.
4	Repeat step 3 using the other endpoint of the diameter.
5	Mark the intersections of the two circles, and label them T and R .
8	Connect the points, T and R with the endpoints of the diameter to create a square.

Use Point A to construct a square inside a circle.
