

Complete the missing steps showing one way to construct an equilateral triangle inscribed inside a circle.

Step	Procedure
1	Use a compass to draw a circle. Mark the center and label it.
2	Preserve the distance on your compass from the center of the circle to any point on the circle.
3	Mark any point on the circumference of the circle.
4	Place the point of the compass on the point on the circle and make a mark where the compass intersects the circle.
5	Continue around the circle making a total of five small arcs.
6	Mark points where the arcs intersected the circle.
7	Connect every other point to create an equilateral triangle.

Use Point A to construct an equilateral triangle inscribed inside a circle.

Complete the missing steps showing one way to construct a hexagon inscribed inside a circle.

Step	Procedure
1	Use a compass to draw a circle. Mark the center and label it.
2	Preserve the distance on your compass from the center of the circle to any point on the circle.
3	Mark any point on the circumference of the circle.
4	Place the point of the compass on the point on the circle and make an arc where the compass intersects the circle.
5	Continue around the circle making a total of five small arcs.
6	Mark points where the arcs intersect the circle.
7	Connect adjacent points to create a hexagon.

Use Point P to construct a hexagon inscribed inside a circle.
