

Geometry: Unit 13, Lesson 2

1. Write the equation in slope-intercept form of a line perpendicular to $y = \frac{1}{4}x - 6$ passing through the point $(2, 3)$.
2. What is the standard form of the line that has a slope of 4 and passes through the point $(-3, 7)$?

3. Circle S is shown, where points N , W , T , and R are on the circle, and points K and Y are outside the circle. Line segments KR and YK are tangent to the circle. What two line segments are perpendicular?
