

Geometry: Unit 13, Lesson 6

1. Line segment YS with endpoints at point $Y(-2, -4)$ and point $S(4, 2)$ is shown. Using the Pythagorean Theorem, what is the distance from point Y to point S ?

2. Segment RL is shown, with endpoints at point $R(-12, -8)$ and point $L(12, 10)$. What equation can be used to find the length of $\overline{RL}$?

3. Line segments MB with endpoints at point $M(3, -3)$ and point $B(13, -1)$ is shown. Using the Pythagorean Theorem, what is the distance from point M to point B ?
