Geometry: Unit 2, Lesson 7

1. What is the hypothesis in the following statement: "If the measures of two angles add to $180°$, then they are supplementary by the definition of supplementary angles."

2. The Segment Addition Postulate states the following. If points A, X and B are collinear points and point X is between points A and B, then $AX + XB = AB$, by the Segment Addition Postulate. What is the conclusion of the Segment Addition Postulate?

3. The Angle Addition Postulate states the following. If point X is in the interior of $\angle AMB$, then $m\angle AMX + m\angle XMB = m\angle AMB$, by the Angle Addition Postulate. What is the hypothesis of the Angle Addition Postulate?
